Sensitivity of modeling results of the Black Sea level to the choice of boundary conditions on the free surface

Olga Dymova, Sergey Demyshev
olgadym@yahoo.com

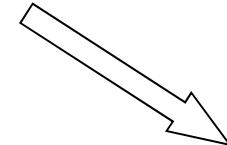

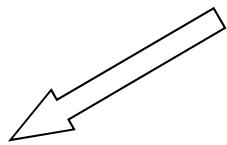

INTERNATIONAL YOUNG SCIENTISTS SCHOOL AND CONFERENCE
on Computational Information Technologies for Environmental Sciences
May 27 – June 6, 2019, Moscow

NUMERICAL EXPERIMENTS

MHI-model [1]

1. Resolution – $0.02^\circ \times 0.015^\circ (\approx 1,6 \text{ km})$;
27 z-levels
2. Vertical mixing – Mellor-Yamada
turbulence closure model 2.5
3. Bathymetry – ODB MHI
4. Forcing – SKIRON 2011
5. Rivers and straits
6. Initial fields – climatic U,V, ζ ,T,S

Experiment 1:

linearized kinematic condition
on the sea surface

$$w|_{z=0} + \frac{\partial \zeta}{\partial t} = \frac{Pr - Ev}{\rho_0}$$

Experiment 2:

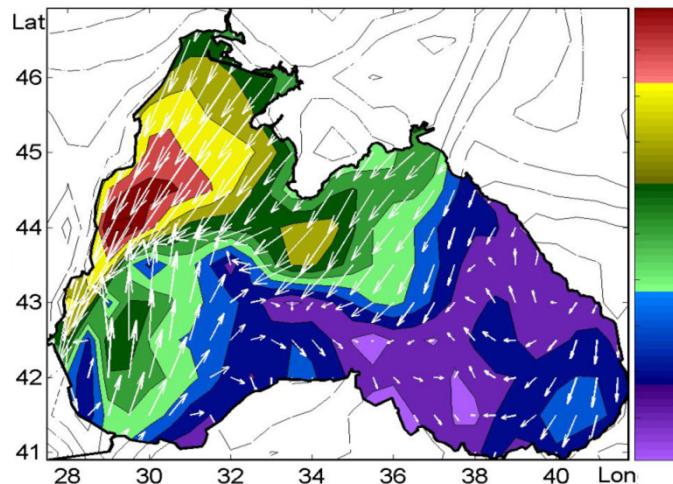

full kinematic condition
on the sea surface

$$w|_{z=0} + \frac{\partial \zeta}{\partial t} + u \frac{\partial \zeta}{\partial x} + v \frac{\partial \zeta}{\partial y} = \frac{Pr - Ev}{\rho_0}$$

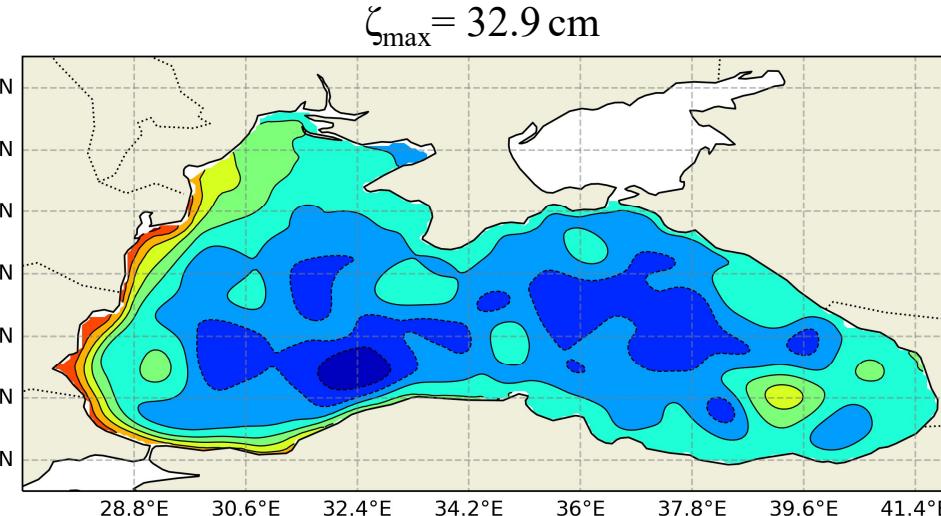

SEA LEVEL MODELING

Storm on 18th October, 2011

Wind speed (m/s) on 17.10.11 by
http://dvs.net.ru/mp/data/vel/jpg/wind/wind_bs_nomad_2011101712.jpg

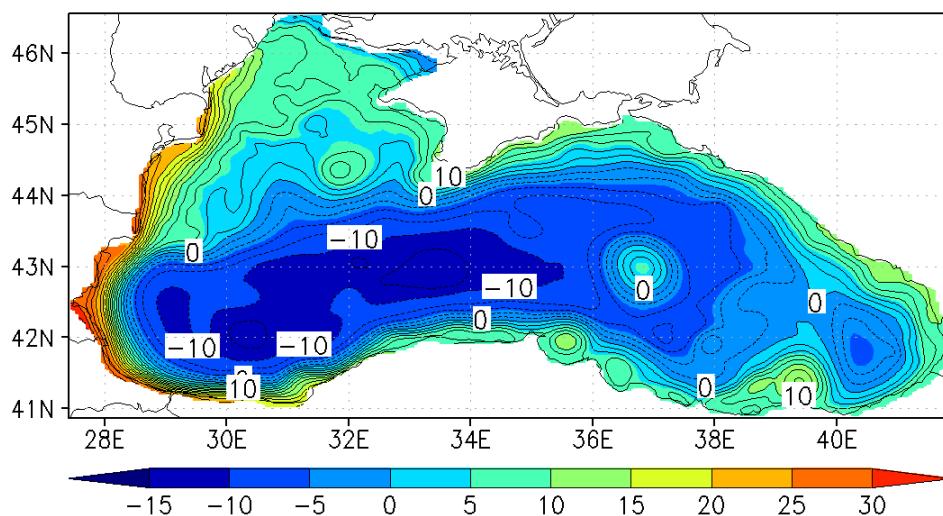

Sea level with altimetry assimilation by
 Marine Predictions Centre of MHI (<http://www.innovation.org.ru>)

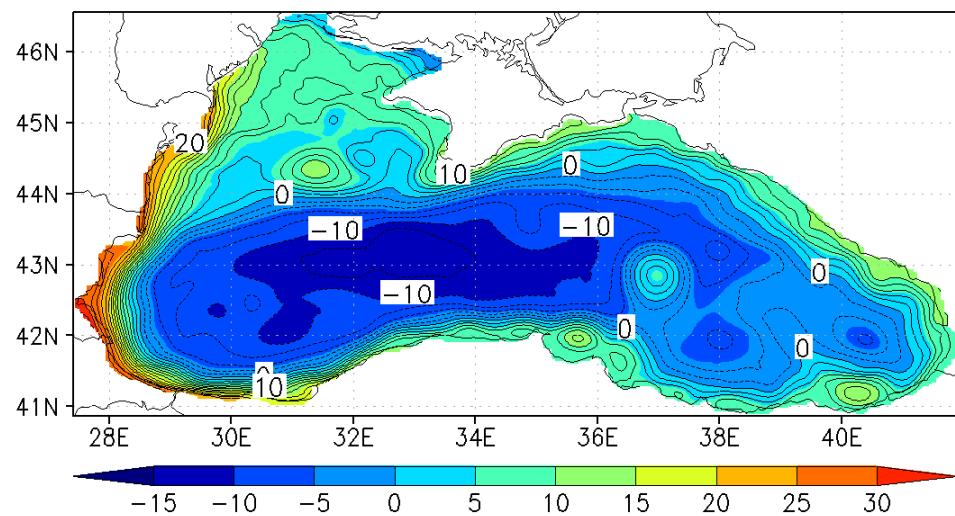

Experiment 1

$\zeta_{\max} = 33.2 \text{ cm}$

Experiment 2

$\zeta_{\max} = 32.8 \text{ cm}$

August 10, 2011
